4004
SINGLE CHIP 4-BIT P-CHANNEL MICROPROCESSOR

- 4-Bit Parallel CPU With 46 Instructions
- Instruction Set Includes Conditional Branching, Jump to Subroutine and Indirect Fetching
- Binary and Decimal Arithmetic Modes
- 10.8 Microsecond Instruction Cycle
- CPU Directly Compatible With MCS-40 ROMs and RAMs
- Easy Expansion—One CPU can Directly Drive up to 32,768 Bits of ROM and up to 5120 Bits of RAM
- Standard Operating Temperature Range of 0° to 70°C
- Also Available With -40° to +85°C Operating Range

The Intel® 4004 is a complete 4-bit parallel central processing unit (CPU). The 4004 easily interfaces with keyboards, switches, displays, A-D converters, printers and other peripheral equipment.

The CPU can directly address 4K 8-bit instruction words of program memory and 5120 bits of data storage RAM. Sixteen index registers are provided for temporary data storage. Up to 16 4-bit input ports and 16 4-bit output ports may also be directly addressed.

The 4004 is fabricated with P-channel silicon gate MOS technology.

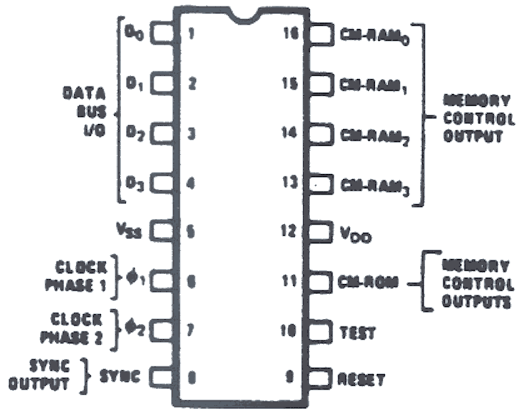
Pin Description



D_0-D_3

BIDIRECTIONAL DATA BUS. All address and data communication between the processor and the RAM and ROM chips occurs on these 4 lines.

RESET

RESET input. A logic "1" level at this input clears all flags and status registers and forces the program counter to zero. To completely clear all address and index registers, RESET must be applied for 64 clock cycles (8 machine cycles).

TEST

TEST input. The logical state of this signal may be tested with the JCN instruction.

SYNC

SYNC output. Synchronization signal generated by the processor and set to the ROM and RAM chips. It indicates the beginning of an instruction cycle.

CM-ROM

CM-ROM output. This is the ROM selection signal sent out by the processor when data is required from program memory.

CM-RAM$_0$ – CM-RAM$_3$

CM-RAM outputs. These are the bank selection signals for the 4002 RAM chips in the system.

ϕ_1, ϕ_2

Two phase clock inputs.

V_{SS}

Most positive voltage.

V_{DD}

V_{SS} -15 ±5% main supply voltage.

Instruction Set Format

A. Machine Instructions

- 1 word instruction – 8-bits requiring 8 clock periods (instruction cycle).
- 2 word instruction – 16-bits requiring 16 clock periods (2 instruction cycles).

Each instruction is divided into two four-bit fields. The upper 4-bits is the OPR field containing the operation code. The lower 4-bits is the OPA field containing the modifier. For two word instructions, the second word contains address information or data.

The upper 4-bits (OPR) will always be fetched before the lower 4-bits (OPA) during M_1 and M_2 times respectively.

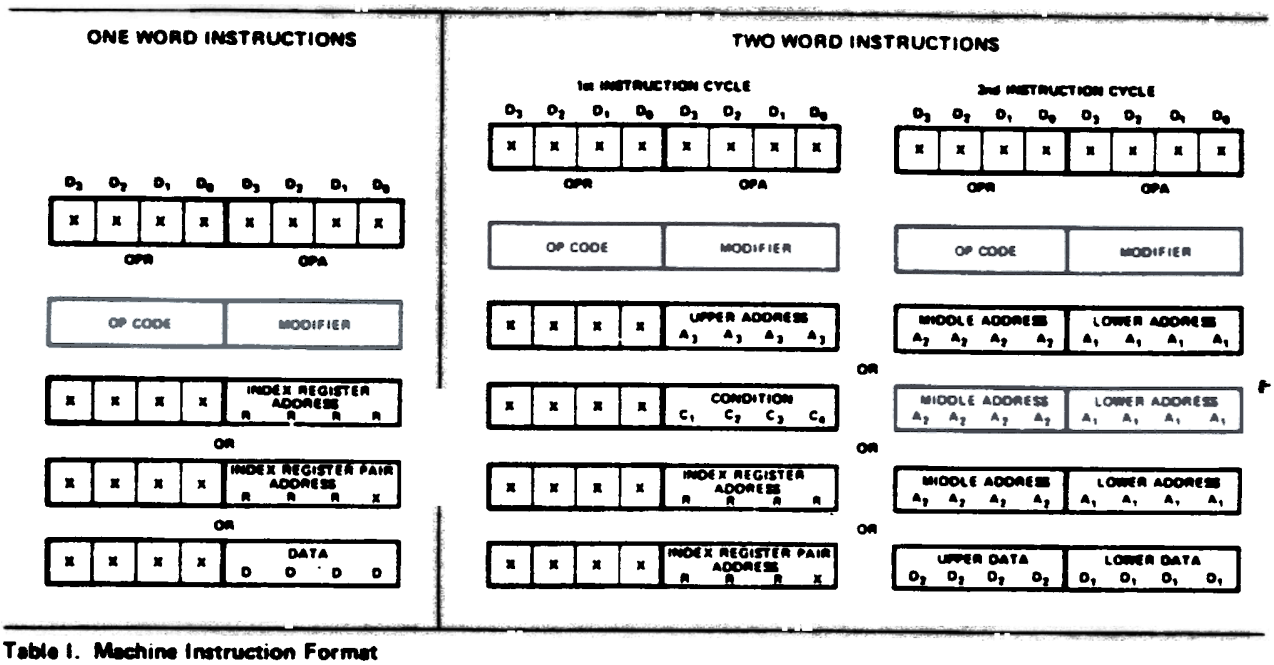


Table I. Machine Instruction Format

B. Input/Output and RAM Instructions and Accumulator Group Instructions

In these instructions (which are all single word) the OPR contains a 4-bit code which identifies either the I/O instruction or the accumulator group instruction and the OPA contains a 4-bit code which identifies the operation to be performed. Table II illustrates the contents of each 4-bit field.
